

1. Sketch a Simple Prototype of a Bus Ticket Booking System using Figma Tool

AIM:

To design and prototype the user interface and user flow for a mobile bus ticket booking application using Figma, demonstrating a complete end-to-end user journey.

PROCEDURE:

- **Design the Search Screen:** Create an initial home screen where users can input travel details such as the departure city, destination city, travel date, and the number of passengers.
- **Design the Results Screen:** Develop a screen to display a list of available buses based on the search criteria. This includes essential details like operators (e.g., BoltExpress, MetroGlide), departure and arrival times, travel duration, and ticket prices.
- **Design the Seat Selection Screen:** Create an interactive visual layout of the bus seating arrangement, using distinct styles to indicate which seats are available, occupied, or currently selected by the user.
- **Design the Passenger Details Screen (visible in image_242c62.jpg):** Construct a form for users to input their personal information (full name, email, phone number) and provide options for add-ons like travel insurance.
- **Design the Booking Confirmation Screen:** Generate a final success screen that serves as a digital ticket or boarding pass. It should summarize the trip details, seat assignment, passenger information, and include a scannable barcode or QR code.
- **Prototype the User Flow:** Link the individual frames together sequentially to simulate a functional booking process.

RESULT:

The outcome is a comprehensive, visually cohesive multi-screen prototype of a mobile bus booking app. It successfully maps out the user experience from the initial route search to the final ticket generation.

2. The stakeholders have conflicting views on the user interface design for an E-Commerce mobile app. Create a prototype using Figma tool to discuss with the stakeholders to get their feedback and approval.

AIM:

To design the user interface for an e-commerce mobile application, visualizing the complete customer journey from product discovery to final checkout and order confirmation.

PROCEDURE:

- **Design the Home Screen:** Create an inviting main page featuring a promotional hero image (e.g., "Quiet Warmth for the Home"), curated categories, and trending products.
- **Design the Category Browse Screen:** Develop a grid layout that allows users to easily browse through specific collections and view multiple items at a glance.
- **Design the Product Detail Screen:** Create a focused view for an individual item (e.g., "Clay Teapot & Cups Set") that includes a product image, price, description, and an "Add to Cart" call-to-action button.
- **Design the Shopping Cart Screen:** Build a summary page where users can review their selected items, check the order subtotal, and proceed to checkout.
- **Design the Checkout Screen:** Construct a form for users to input shipping details and select their preferred payment method (e.g., Apple Pay, Credit Card) to finalize the purchase.

- **Design the Search Screen:** Create an interface to help users find specific items, incorporating features like "Recent Searches" and "Suggested Collections."
- **Design the User Account Screen:** Lay out a profile management page displaying user details, recent order history, and account settings.
- **Design the Order Confirmation Screen:** Generate a final success screen displaying a "Thank you for your order!" message and a button to return to shopping.

RESULT:

The outcome is a cohesive, 8-screen user interface design for a home goods e-commerce app. It successfully establishes a warm, earthy visual identity while mapping out a complete and functional end-to-end shopping workflow.
